# ADULT RESPIRATORY EMERGENCIES

# CHRONIC OBSTRUCTIVE PULMONARY DISEASE

#### FIELD ASSESSMENT/TREATMENT INDICATORS

Chronic symptoms of pulmonary disease, wheezing, cough, pursed lip breathing, decreased breath sounds Accessory muscle use, anxiety, ALOC or cyanosis

## **BLS INTERVENTIONS**

- 1. Reduce anxiety, allow patient to assume position of comfort
- 2. Administer oxygen as clinically indicated, obtain O<sub>2</sub> saturation on room air, or on home O<sub>2</sub> if possible

## **ALS INTERVENTIONS**

- 1. Maintain airway with appropriate adjuncts, including advanced airway if indicated. Obtain O<sub>2</sub> saturation on room air, or on home O<sub>2</sub> if possible
- 2. Nebulized Albuterol 2.5mg, with Atrovent 0.5mg may repeat times two (2)
- 3. For agencies utilizing Continuous Positive Airway Pressure (CPAP)
  - a. Obtain and document O<sub>2</sub> saturation levels every 5 minutes
  - b. Apply and begin CPAP @ "0"cms. Instruct patient to inhale through nose and exhale through mouth.
  - c. Slowly titrate pressure in 3cm increments up to a maximum of 15cms according to patient tolerance while instructing patient to continue exhaling against increasing pressure.
  - d. CPAP should be continued until patient is placed on CPAP device at receiving hospital ED.
  - e. Document CPAP level, O2 saturation, vitals, patient response and adverse reactions on appropriate form
- 4. Consider advanced airway per protocol Reference #4029 Nasotracheal Intubation
- 5. Base hospital physician may order additional medications or interventions as indicated by patient condition.

#### ACUTE ASTHMA/BRONCHOSPASM

## FIELD ASSESSMENT/TREATMENT INDICATORS

History of prior attacks, associated with wheezing, diminished breath sounds, or cough. A history of possible toxic inhalation, associated with wheezing, diminished breath sounds, or cough Suspected allergic reaction associated with wheezing, diminished breath sounds or cough

#### **BLS INTERVENTIONS**

- 1. Reduce anxiety, allow patient to assume position of comfort
- 2. Administer oxygen as clinically indicated, humidified oxygen preferred

# **ALS INTERVENTIONS**

- 1. Maintain airway with appropriate adjuncts, obtain O<sub>2</sub> saturation on room air if possible.
- 2. Nebulized Albuterol 2.5mg, with Atrovent 0.5mg may repeat times two (2).
- 3. For signs of inadequate tissue perfusion initiate IV bolus of 300cc NS. If signs of inadequate tissue perfusion persist may repeat fluid bolus.
- 4. For agencies utilizing Continuous Positive Airway Pressure (CPAP).

Reference: 5001 Page: 2 of 3

- a. Obtain and document O<sub>2</sub> saturation levels every 5 minutes
- b. Apply and begin CPAP @ "0"cms. Instruct patient to inhale through nose and exhale through mouth.
- c. Slowly titrate pressure in 3cm increments up to a maximum of 15cms according to patient tolerance while instructing patient to continue exhaling against increasing pressure.
- d. CPAP should be continued until patient is placed on CPAP device at receiving hospital ED.
- e. Document CPAP level, O<sub>2</sub> saturation, vitals, patient response and adverse reactions on appropriate form
- 5. If no response to Albuterol, give Epinephrine 0.3mg SC. Contact Base Hospital for patients with a history of coronary artery disease, history of hypertension or over 40 years of age prior to administration of Epinephrine
- 6. May repeat Epinephrine 0.3mg SQ after 15 minutes
- 7. For suspected allergic reaction, consider Diphenhydramine 25mg IV, or 50mg IM
- 8. For persistent severe anaphylactic shock administer Epinephrine 0.1mg (1:10,000) IV slow push. May repeat as needed to total dosage of 0.5mg
- 9. Consider advanced airway per protocol Reference #4029 Nasotracheal Intubation
- 10. Base hospital physician may order additional medications or interventions as indicated by patient condition.

# ACUTE PULMONARY EDEMA/CHF

#### FIELD ASSESSMENT/TREATMENT INDICATORS

History of cardiac disease, including CHF, and may present with rales, occasional wheezes, jugular venous distention and/or peripheral edema

#### **BLS INTERVENTIONS**

- 1. Reduce anxiety, allow patient to assume position of comfort
- 2. Administer oxygen as clinically indicated. For pulmonary edema with high altitude as a suspected etiology, descend to a lower altitude and administer high flow oxygen with a non re-breather mask
- 3. Be prepared to support ventilations as clinically indicated.

## **ALS INTERVENTIONS**

- 1. Maintain airway with appropriate adjuncts, Obtain O<sub>2</sub> saturation on room air if possible
- 2. Nitroglycerine 0.4mg sublingual/transmucosal with signs of adequate tissue perfusion. May be repeated as long as patient continues to have signs of adequate tissue perfusion. If a Right Ventricular Infarction is suspected, the use of nitrates is contraindicated.
- 3. For agencies utilizing Continuous Positive Airway Pressure (CPAP)
  - a. Obtain and document O<sub>2</sub> saturation levels every 5 minutes
  - b. Apply and begin CPAP @ "0"cms. Instruct patient to inhale through nose and exhale through mouth.
  - c. Slowly titrate pressure in 3cm increments up to a maximum of 15cms according to patient tolerance while instructing patient to continue exhaling against the increasing pressure.
  - d. CPAP should be continued until patient is placed on CPAP device at receiving hospital ED.
  - e. Document CPAP level, O<sub>2</sub> saturation, vitals, patient response and adverse reactions on appropriate form
- 5. Consider advanced airway per protocol Reference #4029 Nasotracheal Intubation
- 6. Base hospital physician may order additional medications or interventions as indicated by patient condition.
- 7. In radio communication failure (RCF) the following medications may be utilized
  - a. Dopamine 400mg in 250cc NS titrated between 5 20mcg/min to maintain adequate tissue perfusion
  - b. Furosemide 40mg-100mg IV or 2 times the daily dose to maximum of 100mg IV
  - c. Nebulized Albuterol 2.5mg with Atrovent 0.5mg after patient condition has stabilized
